Summary

Additional information can go here and be formatted to APA 6th guidelines or something else. The supporting information and main document can use the same `research_report.bib` file so the references match. With `\usepackage[xr,user,titleref]{zref}`, you can cross-reference back and forth between documents ...the main report and this SI. For instance here is a reference to Figure 2 in the main document. The reference is via the label, i.e., `\zlabel{ms:multipanel}` so if the figure is moved to a different page or its number changes because of additions or deletions, this reference by number will update automatically. The

following sections show the source files that generated the plots, figures, manuscript and supporting information pdfs. For APA L^AT_EX style variations on CTAN, see [APA 6th docs](#) and [APA 7th docs](#).

System setup

Installing conda environments

If you already use conda environments in a recent linux operating system, you can install a minimal conda environment to run the notebooks like so and follow the prompt (or omit `-y` to the end of the command to install the packages without prompting).

```
conda create -n apa67_report pandas pyarrow matplotlib jupyter firefox -y
$ activate apa67_report
$ jupyter notebooks
```

If you are not yet set up to use conda environments, you can follow the instructions to download and install a minimal conda installer, miniconda3 ([link](#)). This provides just enough infrastructure to create a conda environment and install packages as shown in the example above. If you want to create conda environments and install packages faster, then install the 'mamba' conda package ([link](#)).

If you are not yet set up to use conda environments and don't want to be then you are on your own. You can run `pipeline_1.ipynb` if you have numpy, pandas, matplotlib and jupyter. You need the `spudtr` package to run `pipeline_2.ipynb`. Older versions are available via pip install, but there is no assurance it is compatible with the versions of packages you already have installed.

Installing L^AT_EX

Linux Installation via network. You do not need to be root or admin to install TeX Live over the networks and best practices are to install your copy in your directory. That way you control the version and packages you use. First read through the quick installation instructions [here](#). Then, (summarizing from <https://www.tug.org/texlive/acquire-netinstall.html>):

1. Download [install-tl-unx.tar.gz](#) to some scratch/working directory, unpack the archive, change to the new directory it made, i.e., `install-tl-YEARMONTHDAY` for whatever version, and run the installer.

```
$ tar -xf install-tl-unx.tar.gz
$ cd install-tl-20200814
$ perl install-tl
```

Follow the prompts, make sure you are happy with and have write permissions in the default installation directory, and press "i" to install.

2. Update your `/.bashrc` file with the path to the new TeX Live installation.

```
PATH=/home/turbach/texlive/2020/bin/x86_64-linux:$PATH
INFOPATH=/home/turbach/2020/texmf-dist/doc/info:$INFOPATH
MANPATH=/home/turbach/2020/texmf-dist/doc/man:$MANPATH
```

That's it, you have a complete functioning installation of L^AT_EX with the latest packages, TeX Live 2020 as of this writing.

The installation probably has everything you need including the apa6 and apa7 styles used for this report.

If there is a new package or update you want and you want to manage the TeX packages with the TeX Live GUI you also need to install perl/tk. There is a conda package for this, you can install into any compatible conda env.

```
$ conda activate some_general_purpose_env  
$ conda install perl-tk -c BioBuilds -y
```

OSX Installation. See instructions for MacTeX [here](#).

Windows. See Quick Install instructions [here](#)
and Windows installer instructions [here](#).

Source: `author_analysis.ipynb`

The pdf of the notebook is generated by `jupyter convert ... -to pdf`. The LaTeX package `pdfpages` is used to slurp it into the SI pdf.

apa_analysis

September 5, 2021

1 Reproducible results for L^AT_EX manuscripts

- arbitrary narrative text and results
- pandas L^AT_EX table generation
- custom APA-style table generation
- APA-style graphics styled with matplotlib style sheets

WARNING: Running this code the first time downloads an 87MB EEG data file to your disk from Zenodo.

The package dependencies are python, numpy, pandas, pyarrow, matplotlib, jupyter

2 The reproducible data analysis

Set up Python packages for data analysis and visualization

Guard the conda environment and EEG file MD5 checksum

```
[1]: import os
import re
import copy
import hashlib
import warnings
from pathlib import Path
import pprint as pp
import platform
import numpy as np
import pandas as pd

# matplotlib and packages for plot tuning
import matplotlib as mpl
from matplotlib import pyplot as plt
from matplotlib import cycler
from matplotlib import cm

# guard conda environment
conda_env = os.environ["CONDA_DEFAULT_ENV"] if "CONDA_DEFAULT_ENV" in os.
↳environ.keys() else None
```

```

if conda_env and not conda_env == "apa67_report_090421":
    msg = (
        f"unknown conda env {conda_env}, to reproduce the report on linux_
        ↪create run these:\n\n"
        f"    conda create -n apa67_report_090421 --files environment.txt\n"
        f"    conda activate \n\n"
    )
    warnings.warn(msg)

# fetch the EEG recording from Zenodo if it isn't found locally
ARCHIVE = r"https://zenodo.org/record/4099632/files/"

DATA_F = "sub000p3.ms1500.epochs.feather"
if not Path(DATA_F).exists():
    print(f"downloading {DATA_F} from Zenodo ... please wait")
    pd.read_feather(ARCHIVE + DATA_F).to_feather(DATA_F)

# a bit of data validation
assert n_standards + n_targets == event_table["All"]["All"]

# compute the proportion ... a derived value
p_targets = n_targets / (n_standards + n_targets)
n_trials, n_standards, n_targets, p_targets
```

```
[7]: (239, 201, 38, 0.1589958158995816)
```

```
[8]: # embed data into formatted LaTeX via the variables

arbitrary_text = f"""
% These two paragraphs are generated when the analysis is run

The essential feature of reproducible report generation is linking
data from the analysis with the text of the report. Style conventions
like APA 6th, 7th and others are
strict and varied which means the only general solution is a mechanism
for linking the analysis data and results to arbitrary text formatted
arbitrarily. This is an old problem, solved long ago by string formatting
functions, e.g., \mintinline{c}{sprintf()} in C, which reappears in
```

various forms in scripting languages like R, MATLAB, and Python where the f-string function (Python 3.6+) streamlines mixing text and variables.

To illustrate, the same Jupyter notebook that runs the analysis also generates a text file containing the entire contents of the preceding paragraph and this one, including the following sentence that describes the number of trials in each experimental condition.

```
%%
```

```
%% In the next sentence, the Python f-string formatter embeds variables  
%% computed during the analysis directly into the generated text which  
%% typeset to APA 6th style specifications.
```

```
%%
```

```
After screening artifacts, the proportion of target trials in the data  
analyzed was {p_targets:0.3f} ({{\it N}} = {n_trials} trials, {n_standards}  
standards, {n_targets} targets).
```

```
%%
```

```
This narrative description formats the quantitative results in APA 6th style  
while the values are filled in by the same variables used to compute them. This  
technique can be used to generate reproducible descriptions of an  
entire results sections or portions thereof.
```

```
"""
```

```
# show (optional)
```

```
print(arbitrary_text)
```

```
# write the text to a file for import into the manuscript
```

```
with open("generated/arbitrary_text.tex", "w") as fh:
```

```
    fh.write(arbitrary_text)
```

```
% These two paragraphs are generated when the analysis is run
```

The essential feature of reproducible report generation is linking data from the analysis with the text of the report. Style conventions like APA 6th, 7th and others are strict and varied which means the only general solution is a mechanism for linking the analysis data and results to arbitrary text formatted arbitrarily. This is an old problem, solved long ago by string formatting functions, e.g., `\mintinline{c}{sprintf()}` in C, which reappears in various forms in scripting languages like R, MATLAB, and Python where the f-string function (Python 3.6+) streamlines mixing text and variables.

%% computed during the analysis directly into the generated text which
%% typeset to APA 6th style specifications.
%%
After screening artifacts, the proportion of target trials in the data
analyzed was 0.159 ({\it N} = 239 trials, 201
standards, 38 targets).
%%
This narrative description formats the quantitative results in APA 6th style
while the values are filled in by the same variables used to compute them. This
technique can be used to generate reproducible descriptions of an
entire results sections or portions thereof.

```

5 Example: Table 1

An easy LaTeX table with `pandas.DataFrame.to_latex()`

The output is not quite APA 6th style.

```

[9]: # show
      print(event_table.to_latex())

      # save
      event_table.to_latex('generated/p3_table1.tex')

```

```

\begin{tabular}{lrrrr}
\toprule
tone & hi & lo & All & \\
stimulus & & & & \\
\midrule
standard & 107 & 94 & 201 & \\
target & 14 & 24 & 38 & \\
All & 121 & 118 & 239 & \\
\bottomrule
\end{tabular}

```

6 Example: Table 2

An APA 6th style LaTeX table built with Python

Build the header, data rows and columns, footer strings, then write the LaTeX file.

```

[10]: def df_to_tex(df):
        """format df values as a LaTeX string of rows x columns table data"""

```

```

    df_str = df.applymap(lambda x: f"{x}".capitalize()) # convert the data to
    ↪APA style text
    tex_cols = df_str.apply(lambda row: " & ".join(row), axis=1) # join the
    ↪columns with &
    tex_rows_cols = (r" \\ " + "\n").join(tex_cols) # join the rows with \\
    return tex_rows_cols

# 1. build the table header by hand thanks to APA style
table1_header = f"""
\\begin{{tabular}}{{l1l1l}}
\\toprule
& \\multicolumn{{2}}{{c}}{{Tone}} & \\
\\cmidrule{{2-3}}
& {" & ".join([s.capitalize() for s in event_table.columns])} \\
\\midrule
"""

# 2. build the table rows and columns
table1_rows = df_to_tex(event_table.reset_index())

# 3. build table footer
table1_footer = "\\ \\ \\n\\bottomrule \\n\\end{{tabular}}"

# assemble the text
table1_tex = table1_header + table1_rows + table1_footer

# show
print(table1_tex)

# save for the manuscript
with open("generated/p3_table2.tex", "w") as fh:
    fh.write(table1_tex)

```

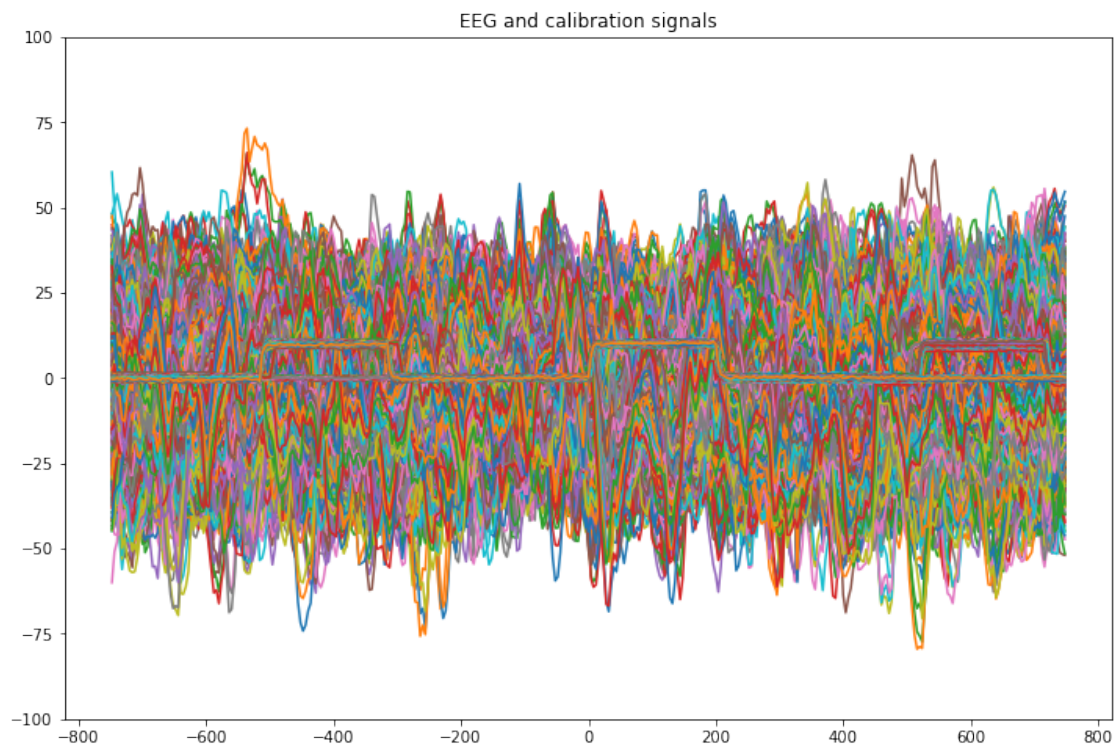

```

\\begin{tabular}{l1l1l}
\\toprule
& \\multicolumn{2}{c}{Tone} & \\
\\cmidrule{2-3}
& Hi & Lo & All \\
\\midrule
Standard & 107 & 94 & 201 \\
Target & 14 & 24 & 38 \\
All & 121 & 118 & 239\\
\\bottomrule
\\end{tabular}

```

6.1 EEG data preview

```
[11]: f_eeg, ax = plt.subplots(figsize=(12, 8))
      ax.set_title("EEG and calibration signals")
      ax.set_ylim(-100, 100)
      times = p3_df.time_ms.unique()
      for epoch_id, epoch in p3_df.groupby("epoch_id"):
          ax.plot(times, epoch[EEG_COLUMNS])
```

6.2 Compute time-domain average ERPs

```
[12]: p3_erp = p3_df.groupby(["stimulus", "time_ms"]).mean()[EEG_COLUMNS]
      p3_std = p3_df.groupby(["stimulus", "time_ms"]).std()[EEG_COLUMNS]
      p3_n = p3_df.groupby(["stimulus", "time_ms"]).count()[EEG_COLUMNS] # n's
      ↪ differs by condition after data QC

      for df in [p3_erp, p3_std, p3_n]:
          df.columns.name = "channel"
```

6.3 Example Figure: P300 midline ERP plots with Psychological Science matlab style sheets

<https://www.psychologicalscience.org/publications/aps-figure-format-style-guidelines>

2020-08-11

(emphasis in bold added here)

Details:

Please note that yellow may not show up well, especially in line graphs.

In **all labels including the key(the first letter of each important word and of any word of at least 4 letters should be capitalized.**

Exception: Units of measure indicated in parentheses don't have the first letter capitalized, e.g., "Response Time (ms)."

Minus signs **NOT HYPHENS** should be used to indicate negative numbers or subtraction (a minus sign can be inserted by holding down the key on a computer keyboard while pressing 0, 1, 5, 0 on the number pad, in sequence).

Do not insert a box around a key or a figure.)

A graph should have two axes (ordinate and abscissa) only. Do not include extraneous axes. In mathematical expressions, there should be a single letter space before and after each operator: =, ×, +, ?, <, >, etc.

Exception: Do not insert spaces in subscripts or superscripts.

The **ordinate axis must be labeled to indicate the nature of the quantities referred to.** For example, if a graph shows response times (ordinate) in various conditions (abscissa), the ordinate must be labeled "Response Time," in addition to showing the numerical values.

Numerical values on the ordinate axis should be oriented horizontally. If a figure includes error bars, they must be explained in the caption. In the case of a bar graph, be sure that error bars are easily visible (e.g., a black error bar will be invisible in a data bar with a black or dark-gray fill).

Font style and size:

Labels and numbers in figures should be in **Helvetica Neue 57 Condensed roman font.** (If you do not have this font installed on your device, please use regular **Helvetica** or Arial font.)

Do not use boldface font unless it's intended to highlight something. In that case, the caption should explain what the boldface indicates.

Symbols referring to variables should be in Helvetica Neue 57 Condensed italic font. (If you do not have this font installed on your device, please use regular Helvetica or Arial font.) Otherwise, do not use italics.

Greek letters (e.g., regression coefficients) should not be in italics.

All **ordinate and abscissa** quantities, or any sublabel along the ordinate or abscissa, should be in **9-point** font.

All **main ordinate and abscissa labels** should be in **10-point** font.

The **title** header (at the top of a figure), if there is one, should be in **12-point** font.

Keys should be in **9-point** font.

This includes the height of boxes illustrating fills in a bar graph and symbols used to differentiate lines in a line graph.

Whenever possible, the **key should be placed toward the top of a graph** (i.e., toward the top inside the graph or above the graph, as space allows).

Symbols (e.g., squares, diamonds) plotted in a graph should be no smaller than the corresponding symbols in the key.

Panel labels (a, b, c, etc.) should be in 18-point font, lowercase, positioned to the upper left of the corresponding panels. They should not be followed by periods or surrounded by parentheses.

All other text in graphs (e.g., a label for a graphed line or symbol) should be in **9-point** font.

82 \abstract{When the culmination of research is a research report, the
83     culmination of reproducible research must be a reproducible
84     report. To accomplish this, three problems must be solved: 1) the
85     results of the reproducible data analysis must be incorporated into
86     the narrative text, tables, and figures of the document; 2) the
87     document must comply with the byzantine typographical requirements
88     of professional publication style guides and their idiosyncratic
89     modifications by various publishers; 3) the different parts and
90     pieces of the report (manuscript, supplementary information,
91     figures, tables, captions) must be reproducible digital objects in
92     whatever specific document and image file format is required by the
93     online platforms for submission to the journal and production by the
94     publisher. This report describes and demonstrates a flexible and
95     generalizable approach that combines freely available open source
96     data analysis and document preparation software tools to solve these
97     three problems. The report itself is reproducibly generated by the
98     approach it describes and demonstrates for psychologists with
99     real-world examples: the manuscript is formatted in American
100     Psychological Association style and the digital objects are
101     generated as required for the online submission and production
102     platforms used by {\it Proceedings of the National Academy of
103     Sciences}. The source code is publicly available and may be cloned
104     from the GitHub repository

116
117 \section{Introduction}
118
119 For any research project, after all the work of experimental design,
120 implementation, and data acquisition are in place, and the data
121 analysis is complete, there still remains the task of preparing and
122 publishing the peer-reviewed research report with a clear and accurate
123 presentation of the results through the text, tables, and
124 figures. However, the ``research report'' is an abstraction; in
125 practice it takes various forms on its trajectory from the authors'
126 desks to dissemination as a journal article in print and online in
127 digital form(s). For the authors, there all the usual chores of
128 document preparation: Writing the narrative text with qualitative and
129 quantitative analysis results, creating high-resolution graphics for
130 figures, preparing tables of data and results, adding and deleting
131 citations and bibliographic references, embedding links to URLs, and
132 aligning cross-references to elements within or across documents,
133 e.g., to the separate online supplementary information. During
134 preparation and revision the report is in flux and must be editable
135 with changes to the text tracked across versions. For pre-print
136 archives and (re-)submission to peer-reviewed journals the text and
137 graphics are composited into a usually un-editable but easily
138 transmissible and viewable digital snapshot, e.g., typically Portable
139 Document Format (PDF). Finally, for journal and book publishers, the
140 process is unwound and the report must be comprised of separate
141 editable text and ``camera ready'' high-resolution graphics suitable
142 for production in digital form for online viewing and print
143 form. Throughout these transformations for publication, the report
144 must also satisfy specific style requirements and for psychologists
145 this often means a variation of the 6th Edition of
146 the Publication Manual of the American Psychological
147 Association~(\cite{APAStyle6th}). Or maybe the 7th Edition. In short,
148 as a research report evolves from inception to DOI, it must sometimes
149 change and other times freeze in various highly specific forms and
150 digital file formats as it passes through different hands with
151 different requirements.
152
153 When the goal of reproducible research is fully embraced, the
154 ``research report'' must also be reproducible throughout these stages
155 of preparation, revision, submission, and production. This requires
156 solving three problems: 1) the results of the reproducible data
157 analysis must be incorporated into the narrative text, tables, and
158 figures of the document; 2) the document must comply with the
159 byzantine typographical requirements of professional publication style
160 guides and their idiosyncratic modifications by various publishers; 3)
161 the different parts and pieces of the report (manuscript,

```

supplementary information, figures, tables, captions) must be reproducible digital objects in whatever specific document and image file format is required by the vagaries of an online journal submission platform and then subsequently by a different online production platform. Solutions to each of these problems individually abound, the challenge is to combine them reproducibly. For instance, reproducible data analyses are becoming commonplace though the use of scientific computing platforms and open source scripting languages like Python and R encapsulated in virtual environments (conda, virtualenv) and containers (Docker, singularity). However the technology for solving the data analysis problem is decoupled from the strict typesetting requirements of different publication styles. On the other hand, mature document preparation software like Microsoft Word and `\LaTeX{}` provide the fine-grained control of formatting necessary to comply with idiosyncratic style guidelines. However, typing or copy-pasting the results decouples the report from the analysis. The results of the analysis may be reproducible when the analysis is revised by co-authors or reviewers, but the results do not propagate to all the digital objects that comprise the parts and pieces of the report for (re-)submission and production.

This self-reproducing tutorial describes and demonstrates one approach to solving all three problems at once using mature freely available open-source computer software, a working knowledge of `\LaTeX{}`~(`\cite{latexproject}`), and no more knowledge of computer programming than is already required to implement the reproducible data analysis it reports. The tutorial includes a sample reproducible data analysis pipeline with open-access data but focuses mainly on the reproducible report per se, i.e., solutions to the second and third problem needed to bridge the gap between the end of the reproducible data analysis and the DOI of the peer-reviewed publication in an academic journal. In addition to programmatically combining the data analysis results with the narrative text, tables, and figures of the report, the complete `\LaTeX{}` source code listings in the Supplementary Materials provide working examples of some features generally useful for manuscript preparation: tracking changes across revisions, preparing camera ready graphics, automating cross-references within and between documents, formatting and masking the citations and bibliography, generating Portable Document Files, compositing documents and pieces of documents in text and PDF file formats, and preparing an author's manuscript for distribution while a published article is embargoed. The Supplementary Information provides instructions for installing the open source software required to reproduce the data analysis and this report. The complete source code for the data analysis and report generation is publicly available and may be downloaded from the Open Science Foundation archive or cloned from the GitHub repository under a Creative Commons CC BY 4.0 license~(`\cite{ccby4.0}`) and used as a template and freely modified for other purposes with appropriate attribution.

`\section{Method}`

`\begin{figure}[ht]`

`\caption{Generating a reproducible APA 6th style research report: 1)`

Executing the reproducible data analysis code generates the complete

```

217 results which appear as-is in the Supplementary
218 Information. Selected results to be reported in the manuscript are
219 exported to separate files as minimally styled narrative text and
220 tables, and PDF graphics. 2. The graphics exported by the analysis
221 are converted to camera ready APA-style figure graphic PDFs for the
222 manuscript. 3. The Supporting information \LaTeX{} file is typeset
223 as a document PDF which includes the complete analysis source,
224 results, graphics, and document source. 4. The \LaTeX{} manuscript
225 is typeset as a document PDF which includes the results text
226 generated by the data analysis, the camera ready PDF figures, and
227 bibliography.} \zlabel{ms:report_generation}
228 \includegraphics[width=.95\textwidth]{images/report_generation.png}
229
230 \end{figure}
231
232
233 This approach to generating reproducible research reports requires
234 the four main components, outlined schematically in
235 Figure~\zref{ms:report_generation}. While the approach is flexible and
236 generalizable, the specific examples are selected for researchers in
237 Psychology and demonstrate how to satisfy all the requirements (except
238 word count) for submitting and publishing a research report in the
239 journal, {\it Psychological Science}. Accordingly the manuscript is
240 structured with a Cover Page, Abstract, Introduction, Method, Results,
241 and Discussion~\parencite{APSStructStyle} and formatted according to
242 the APA 6th edition style~\parencite{APAStyle6th}. The approach here
243 is readily adapted to the APA 7\textsuperscript{th} Edition with a
244 change of the document
245 class~(\href{https://www.overleaf.com/project/5f3053af0af0dc00016f191b}{apa7})
246 and minor modifications to the text described in Supporting
247 Information. The approach generalizes to other publication styles for
248 which \LaTeX{} style files have been defined. A conveniently inventory
249 is collected here:
250 \href{https://www.overleaf.com/latex/templates/tagged/academic-journal}{Overleaf.com
251 Templates\textemdash Academic Journal}. Many styles are community
252 contributions, for instance,
253 \href{https://www.overleaf.com/latex/templates/tagged/arxiv}{arXiv},
254 bioRxiv}.
255 %
256 A number of journals and publishers provide official styles, such as

```

272   }{
273     SAGE
274   },
275   %
276   the publisher of {\em Psychological Science}.
277   %
278   The Supporting Information for this report provides installation
279   instructions for the necessary software and complete source code
280   listings for the analyses, documents, and figures which are freely
281   available under the CC-BY-4.0 license and may serve as templates for
282   a range of research projects in the psychological sciences.
283
284
285   \subsection{Data analysis pipeline: \mintinline{bash}{apa_analysis.ipynb}}
286
287   For demonstration purposes, a toy reproducible data analysis pipeline
288   is implemented in a Jupyter notebook running a Python
289   kernel~(\cite{kluEtAl2016}). The pipeline (down)loads and
290   transforms a sample EEG dataset~(\cite{Urbach2020z}), computes summary
291   measures, and generates figures and text output. The particulars are
292   incidental, the data may as well be response times and the analysis
293   could be implemented in R, MATLAB, or any language that can format
294   numerical values as strings, write string variables to a text file,
295   and export as PDF, EPS, PNG, JPEG (or a format programmatically
296   convertible to one of these). This PDF is used for vector graphics and
297   PNG for raster graphics in this report since these have proved
298   reliable and both support transparency; EPS and JPEG also work if
299   these are required by the publisher.
300
301
302   \subsection{Preparing camera ready figures with \LaTeX{} and Ti{\it k}Z}
303
304   Ideally, graphic images generated by an analysis pipeline will be in
305   final ``camera ready'' form but this is not always practical or
306   possible. A figure may require annotations, e.g., math notation, not
307   supported by the figure generator and a multipanel figure may need to
308   combine images from different sources. To demonstrate how this may be
309   done programmatically for reproducibility, three of the ``rough'' plot
310   graphics generated by the analysis pipeline are reconfigured, annotated
311   and converted into two camera-ready APA-style manuscript figures
312   (Figure~\zref{ms:multipanel} and Figure~\zref{ms:tikzfig}) using \LaTeX{} and
313   the Ti{\it k}Z graphic library without additional software or manual
314   editing.
315
316
317   \subsection{Manuscript: \mintinline{bash}{apa_ms.tex}}
318
319   LaTeX{} is a form of markup language where
320   the document text is intermingled with short typesetting
321   instructions. For instance, {\it this phrase is typeset in italics},
322   and the instruction looks like this:
323   %
324   \mintinline{latex}{\{\it this phrase is typeset in italics\}}.
325   %
326   Mathematical symbols and more complex equations are very

```

```

327 well-supported and set in the same way, e.g., partial eta squared
328 ( $\eta_p^2$ ) is set like so: \mintinline{latex}{ $\eta_p^2$ }. Other
329 instructions are more general. For instance, the manuscript document
330 begins with this,
331 \mintinline{latex}{\documentclass[man,helv,10pt,draftall,floatsintext]{apa6}},
332 that says to typeset the document as a manuscript, in Helvetica 10
333 point font with a draft watermark on all pages, formatted to the APA
334 6th Edition style except that tables and figures should be placed near
335 where they appear in the text ('floatsintext') rather than collected
336 at the end. This style, including the deviation from the APA 6th table
337 and figure position, corresponds to the submission guidelines for
338 Psychological Science~\parencite{PsychSciSubmissions2020}. Like all
339 \LaTeX{} files, the main manuscript file is a plain text document and
340 thus virus-free, portable, viewable, and editable with any text
341 editor, although one that supports LaTeX syntax highlighting
342 on-the-fly syntax error checking is strongly recommended.
343
344 \subsubsection{Supplementary Information: \mintinline{bash}{apa_si.tex}}
345
346 Supplementary Information is as much a part of the report as the
347 manuscript and must be likewise reproducible. For demonstration here,
348 the Supplementary Information is comprised of a separate \LaTeX{}
349 file. It provides instructions for downloading this report from
350 public repositories and installing the software to reproduce it. It
351 also includes source code listings of the Makefile used to reproduce
352 portions or all of the analysis, source code and output of the entire
353 executed analysis Jupyter notebook and listings of all the \LaTeX{}
354 files used to generate the report, figures, and supporting
355 information, which includes the self-reflexive listing of the
356 Supporting Information listing itself.
357
358
359 \subsection{Reproducing the report: \mintinline{bash}{Makefile}}
360
361 The \mintinline{bash}{make} program is a widely used command line
362 utility for managing the execution of a interdependent computer code
363 in complex programming projects, where changes in one file may might
364 impact some but not all other files. Reproducible data analysis and
365 report generation is similar in that, e.g., generating the
366 camera-ready figure PDFs depends on the rough plots generated by the
367 analysis which in turn depends on executing the analysis. The make
368 utility provides a useful mechanism for expressing the
369 interdependencies and compartmentalizing the project as work
370 progresses, e.g., \mintinline{bash}{make analysis} or
371 \mintinline{bash}{make fig2} or \mintinline{bash}{make ms} while
372 \mintinline{bash}{make all} ensures that all the components execute in
373 the correct order to completely reproduce the analysis and generate
374 all the files and documents for the figures, manuscript, supporting
375 information. Here is a summary of the make file components for
376 generating this report, execution times are for a high performance
377 workstation.
378
379 \begin{description}
380
381 \item [\mintinline{bash}{make analysis} (45 s)] Reproduce the data analysis by

```

```

382     executing all the computer code in the analysis notebook start to
383     finish. This has four side effects:
384
385     \begin{enumerate}
386     \item The data analysis computations are executed and the results captured
387           as standard output and plots in the Jupyter notebook cells.
388     \item Results to be included in the manuscript as narrative text and
389           tables are embedded in text strings, minimally formatted to APA
390           style with \LaTeX{}, and exported as separate text files (.tex).
391     \item Plots to be included in the manuscript figures are exported as
392           PDF graphics.
393     \item After execution is complete, a snapshot of the complete
394           notebook\textemdash text, computer code, and results captured in
395           the output cells\textemdash is exported to a PDF file. The PDF is
396           included in its entirety in the Supplementary Information.
397     \end{enumerate}
398
399     \item [\mintinline{bash}{make fig1} (1 s)] Run
400           \mintinline{latex}{pdflatex fig1.tex} to convert two rough plot
401           graphics as generated by the analysis pipeline into the camera-ready
402           Figure~\zref{ms:multipanel} graphic shown in the manuscript.
403
404     \item [\mintinline{bash}{make fig2} (1 s)] Run \mintinline{latex}{pdflatex fig2.tex}
405           to convert the rough plot graphic generated by the analysis
406           pipeline into the camera-ready Figure~\zref{ms:tikzfig} graphic shown in the
407           manuscript.
408
409     \item [\mintinline{bash}{make figs} (47 s)] Execute the analysis to generate the rough PDF graphic
410           output files then make fig1 and fig2 as above.
411
412     \item [\mintinline{bash}{make ms} (9 s)] Run \mintinline{bash}{pdflatex apa_ms.tex}
413           to generate the manuscript PDF.
414
415     \item [\mintinline{bash}{make si} (4 s)] Run \mintinline{bash}{pdflatex apa_si.tex}
416           to generate the Supporting Information PDF.
417
418     \item [\mintinline{bash}{make all}] Run make figs to execute the
419           analysis and generated camera ready figures then make ms and si
420           enough times to update and the cross-references between the
421           manuscript and supplementary information.
422
423     \end{description}
424
425
426     \label{sec:results}
427
428     \section{Results}
429
430     The results are this report and the Supplementary Information. Both
431     are reproducibly reproduced using freely available open source
432     software, a working knowledge of \LaTeX{} and no more computer
433     programming than the Python used for the data analysis. A few points
434     merit further discussion.
435
436     \section{Discussion}

```

```

437
438 \subsection{Linking data and arbitrary text}
439
440 % This is the complete latex for this entire section
441 \input{generated/arbitrary_text.tex}
442
443
444 The listing below shows the minimally styled \LaTeX{} text generated
445 by the analysis pipeline. For illustration, it includes comments
446 (\% \%), narrative text with the data values filled in programmatically,
447 and \mintinline{latex}{\it N}}, which italicizes the capital N
448 according to APA 6th style:
449
450 % this shows it as a source listing
451 \inputminted{latex}{generated/arbitrary_text.tex}
452
453
454 \subsection{Tables}
455
456 The ability to link data with arbitrary text is nowhere more valuable
457 than in preparing reproducible data tables styled to editorial
458 standards. The primary challenges are the intricate requirements for
459 laying out headings and notes as illustrated by the following excerpts,
460 drawn from the 40 pages of APA Publication Manual 7th edition table
461 guidelines:
462
463 \begin{quote}
464 {\bf headings} Tables may include a variety of headings depending on
465 the nature and arrangement of the data. All tables should include
466 column headings, including a stub heading (heading for the leftmost
467 column). Some tables also include column spanners, decked heads, and
468 table spanners (see Section 7.12)
469
470 \ldots
471
472 {\bf notes:} Three types of notes (general, specific, and probability)
473 appear below the table as needed to describe contents of the table
474 that cannot be understood from the table title or body alone \ldots
475 \end{quote}
476
477 \noindent
478 It is straightforward to reproducibly link table text to the analysis
479 data they tabulate. It is less straightforward, but still tractable to
480 do while also generating the three types of notes, four types of
481 headings and column spanners, and a border at the top and bottom of
482 the table, beneath column headings (including decked heads), and above
483 column spanners.' (p. 205)
484
485 The tabular exhibit labeled Table~\zref{ms:table1} illustrates a
486 not-quite conforming tabular array of data. When the analysis runs,
487 the table is reproducibly generated as a \LaTeX{} .tex file with one
488 line of code \mintinline{python}{pandas.DataFrame.to_latex()}.
489 \footnote{
490   For analyses scripted in R, the \mintinline{R}{xtable} library
491   similarly generates \LaTeX{} format table from dataframes

```

```

492   \url{https://cran.r-project.org/web/packages/xtable/index.html}.
493 }
494 The .tex file is imported into the manuscript the same way as the arbitrary
495 text file above.
496
497 \begin{table}[ht]
498   \centering
499   \caption{A non-APA Style data table and note generated
500     as \LaTeX{} by calling \mintinline{python}{pandas.DataFrame.to_latex()}.} \zlabel{ms:table1}
501   \begin{threeparttable}
502     \input{generated/p3_table1.tex}
503     \begin{tablenotes}[flushleft]
504       Note: Python variables are conventionally lower case.
505     \end{tablenotes}
506   \end{threeparttable}
507 \end{table}
508
509 \noindent
510 This approach is simple and easy and well-suited for data tables
511 presented in supporting information where styling requirements are
512 typically less strict. When easily generated tables will not do, the
513 fall back is arbitrary text generation. A few lines of Python code
514 and common string formatting methods suffice to generate the \LaTeX{}
515 required to format the table header, footer, notes and row data to APA
516 style. The following listing shows the programmatically generated
517 \LaTeX{}, the result is shown as Table~\zref{ms:table2}. The Python
518 source code to is Jupyter notebook in the~Supporting
519 Information.

535     \end{tablenotes}
536   \end{threeparttable}
537 \end{table}
538
539
540
541 \subsection{Figures}
542
543 Graphics figures in PNG, PDF, and JPEG can be included in a \LaTeX{}
544 document with the \mintinline{latex}{command}. Of these PDF seems to
545 be the most reliable for vector graphics (plots, line drawings,
546 charts, plots) and PNG for raster graphics. Including figures is

```

straightforward, creating figures for a data analysis reproducibly is another matter. In some case it may be possible to generate camera-ready graphics from the data analysis pipeline itself. Although this takes some effort to fine tune at the outset when Reviewer 2 insists on some mid-stream revision that requires re-running the analysis, the change propagates all the way through to the final figures included in the report. However this is not always possible. One recourse is to use an interactive vector graphics manipulation programs like Inkscape to import the graphic and edit to style but, like manually typing results into a data table, the results may change but the representation of the results does not.

Since hand editing figures amounts to using a mouse to select a sequence of drawing commands, it can be done programmatically with the right vector graphics manipulation tools. In the LaTeX ecosystem, a particularly powerful package for this is `\href{https://en.wikipedia.org/wiki/PGF/TikZ}{Ti{\it k}Z}` and the learning curve is correspondingly steep. However, for simple tasks like laying out and annotating the figures, it is reasonably straightforward. The tikz figure is a canvas with coordinates. Graphics can be placed and aligned, and drawing elements like lines, arrows, and shading added. Figure~\zref{ms:multi-panel} and Figure~\zref{ms:tikzfig} are worked examples of this approach and show how to convert graphics generated by the data analysis into ``camera ready'' figures to APAstyle specifications saved as separate PDF files for upload to the publisher. Figure~\zref{ms:multi-panel} is a simple example that lays out two graphics side by side and Figure~\zref{ms:tikzfig} illustrates a more elaborate example that selects portions of a single graphic, rearranges and resizes them and adds additional graphic and text annotations. The `\LaTeX{}` and `Ti{\it k}Z` code for both figures is listed in the Supplemental Information.

```

\begin{figure}[ht]
  \caption{
    A complete multi-panel color figure generated
    reproducibly from the data to Psychological Science figure
    specifications. The figure is generated using the matplotlib package in
    Jupyter Notebook running a Python kernel. The code illustrates
    some useful Python idioms and matplotlib functionality including
    style sheets, the style context manager, how to lay out panels,
    add labels including with mathematical symbols, and export the figure as
    as a PDF graphic.

621
622
623
624
625
626 \subsection{Citations, masked citations, and references}
627
628 In LaTeX{} citations in the text are indicated by typing commands
629 like \mintinline{latex}{\cite{}} with the author, name, year,
630 parenthesis information for APA style are determined when the document
631 is typeset. Typing the citation commands amounts to
632 ``cite-while-you-write''. LaTeX automatically generates a bibliography
633 in the APA style from the corresponding .bib file (bibliography
634 database) according to the citations that appear in the text. There
635 lots of options for citation format, see the
636 \mintinline{latex}{biblatex} and \mintinline{latex}{apa6} docs for
637 reference. For instance, the \mintinline{latex}{\parencite} command
638 generates a formatted citation in parentheses
639 \parencite{Lampert1986}. The cite command generates one without
640 parentheses, as in \cite{Lampert1986}. When manuscript submission
641 requires citation masking for blind review, the masked variants of the
642 citation commands, e.g., \mintinline{latex}{\maskparencite} can be
643 used: \maskparencite{Lampert1986}. The masked citations are indicated
644 in bold when the manuscript is typeset normally and replaced with {\it
645 (1 citation removed for masked review)} when typeset with the mask
646 option.
647
648 The .bib file is a text file with bibliography entries that have the
649 usual author, title, data, publisher, fields, and a great many others,
650 in a specific format. There are several options for where to get the
651 .bib file. Scientific literature search engines, publisher websites
652 routinely export citations in .bib format which can be copy-pasted
653 instead of tediously typed. If a reference manager is already being
654 used, it may also be able to export its references to .bib format. And
655 there are a number of reference managers that are designed from the
656 ground up to use .bib. As of this writing, the open-source JabRef

```

seems to have emerged as pick of the litter, being fully featured enough to support general use and working across platforms. BibDesk is another option but only runs on OSX. If other options fail, the entry can be typed.

`\subsection{Cross references}`

To cross-reference between elements like tables, figures, and sections `\LaTeX` links them via `\mintinline{latex}{\label}` `\mintinline{latex}{\ref}` pairs. However a more general approach is to use the `\href{https://ctan.org/pkg/zref}{zref}` package which links elements with `\mintinline{latex}{\zlabel}` `\mintinline{latex}{\zref}` pairs that work across documents which the built-in version does not. This is particularly useful for cross-referencing information in the Supplementary Information from the main manuscript and vice version. When there are two or more docs and a series of figures and/or tables and/or document sections in each and have to add or delete another, it is mighty handy to have the references everywhere in both documents automagically update the numbering and page locations. Here is an example cross reference a section in the Supporting Information, if that section title changes so does this reference: `\ztitleref{si:analysis_nb}`. To cross-reference between .tex documents, both documents must be compiled and this may not be possible in all online submission systems, even those that accept .tex format documents. For instance, the PNAS online submission system accepts latex for manuscripts but requires .pdf for supporting information and does not accept uploads of the auxiliary files required by zrefs in the main manuscript which means the submission system cannot correctly compile .tex manuscripts with zrefs.

`\subsection{Tracking changes}`

Revisions to a document marked and tracked in a document in the same way as other types of formatting. With the `\mintinline{latex}{\changes}` package, authors indicate the type of change or markup, e.g., add, delete, replace, highlight, and then bracket the relevant text, like so:

`\mintinline{latex}{\added[id=TPU]{Here is some new text}}`. When the document is type typeset in draft mode: `(\mintinline{latex}{\usepackage[draft]{changes}})`, the changes are highlighted and tagged by author. For instance `\added[id=TPU]{This text is marked by TPU as added}` and `\deleted[id=ABC]{this text is marked by ABC as deleted}`. Furthermore, `\highlight[id=TPU, comment={is this helpful?}]{this text is marked by TPU as highlighted}` and `\replaced[id=XYZ]{this is XYZ's replacement text}{this text was replaced}`.

In draft mode, a list of the changes can be generated by inserting the `\mintinline{latex}{\listofchanges}` command, typically at the beginning or end, though shown here at the end of this section for illustration. Collaborators can review the changes in the pdf and add make further revisions to the .tex document. When the document is typeset for the final version `(\mintinline{latex}{\usepackage[final]{changes}})`, the changes are applied and remaining comments, markup, and annotations

712 stripped, similar to accepting tracked changes in a WYSIWYG
713 document. The draft and final versions may both be useful when
714 resubmission of a document following revision requires both ``clean''
715 version with the changes made and a draft version marked up to
716 indicate where the revisions were made. For cases where there are two
717 versions of a .tex document and the changes are not explicitly marked
718 up inline, the command line utility program
719 `\mintinline{bash}{latexdiff}` can be used to automatically generate a
720 single pdf with the differences between the versions indicated as in
721 changes. Both of these features are best suited to marking revisions
722 and changes in the text of relative similar documents and are not
723 well-suited to track massive restructuring or revisions to figures and
724 tables. Here is the list of changes explicitly marked up in the
725 previous paragraph.

726

727 `\listofchanges`

728

729

730 `\subsection{Compositing documents: files and file formats}`

731

732 Various files and formats are required go submit and publish a
733 research report. These may include a main editable manuscript
734 (document), supporting information (document, data), figures (vector
735 and raster image graphics files), tables, and bibliographic
736 info. Journals and publishers have divergent interests (readability
737 for evaluation in review vs. production for print and digital
738 formats) and (thus) different requirements for document
739 preparation. This is further complicated by open-access policies that
740 require authors to deposit a final pre-publication manuscript if the
741 publisher won't (but most do, eventually). For submission to
742 Psychological Science for instance, the file formats are `\LaTeX` (.tex)
743 for editable text and Portable Document Format (.pdf) for graphics, a
744 vector format that is scalable without loss of resolution. To submit
745 the report to the journal for review the .tex and .pdf graphic files
746 composited into a single .pdf file and all files
747 uploaded-`\cite{PsychSciSubmissions2020, PsychSciFigs2013}`. Whereas the
748 journal submission portal requires the a single composited document
749 with text and graphics all in one, the publisher's portal requires the
750 separate editable text and graphics files, i.e., the .tex and graphics
751 .pdfs.

752

753 Working with `\LaTeX` simplifies some aspects of this by allowing
754 files in different digital formats to be included in documents in
755 various ways. As illustrated by linking results and arbitrary text for
756 narrative descriptions and tables, separate files of `\LaTeX` can be
757 inserted directly into the document as if typed in place. This allows
758 the tables to be reproducibly prepared as separate files (as required
759 by some publishers) and also incorporated in exactly the same form in
760 the body of the manuscript (as also required by these publishers). The
761 same holds for the camera ready graphics for Figure-`\zref{ms:multipanel}` and
762 `\zref{ms:tikzfig}` which are also separate files included as-is in the
763 manuscript. Additionally the `\mintinline{latex}{\includepdf}` package,
764 allows all or selected pages of a multi-page PDF documents to be
765 included in a `\LaTeX` as demonstrated in by the Supplementary
766 Information that includes the entire PDF of the fully executed data

analysis Jupyter Notebook. Finally, the `\mintinline{latex}{\minted}` package used extensively throughout this document will import the contents of separate files into the `\LaTeX{}` document and also highlight the code according to the syntax of the specific language, e.g., Python, R, `\LaTeX{}` which is of great value in documenting scripted reproducible research pipelines. The Supplemental Information demonstrates this by importing and highlighting all the `\LaTeX{}` files used in the production and reproduction of this tutorial report.

`\subsection{Author manuscripts}`

Whereas journals may require submission as a double spaced manuscript, the published articles typeset single space in two columns with figures and tables where they belong are generally easier to read. Switching the `\mintinline{latex}{documentclass}` option from `man` (manuscript) to `jou` (journal) typesets the document in a more-nearly-journal-like format (Figure~\zref{ms:apa67_jou}), which may be useful for distributing working drafts or post-publication author manuscripts during a publisher's embargo period.

```
\begin{figure}
\caption{Example of typesetting this document with the jou option}
\zlabel{ms:apa67_jou}
\centering
\includegraphics[width=.65\textwidth]{images/apa67_jou.png}
\end{figure}
```

`\section{Conclusion}`

There are many ways to prepare a research report but far fewer to do so reproducibly while at the same time satisfying the requirements of publication styles and online journal submission and production platforms. This report illustrates one approach that does so and dovetails with best practices in open science data analysis. Once a reproducible analysis in place, the additional cost of the reproducible report is acquiring a working knowledge of `\LaTeX{}` and if necessary `Ti{\it}Z`.

55 \section{Summary}
56
57 Additional information can go here and be formatted to APA 6th
58 guidelines or something else. The supporting information and main
59 document can use the same research\_report.bib file so the references
60 match. With {\tt \textbackslash usepackage[xr,user,titleref]\{zref\}},
61 you can cross-reference back and forth between documents \ldots the
62 main report and this SI. For instance here is a reference to
63 Figure~\zref{ms:multipanel} in the main document. The reference is via the
64 label, i.e., {\tt \textbackslash zlabel\{ms:multipanel\}} so if the figure
65 is moved to a different page or its number changes because of
66 additions or deletions, this reference by number will update
67 automatically. The following sections show the source files that
68 generated the plots, figures, manuscript and supporting information pdfs.
69 For APA \LaTeX \ style variations on CTAN, see
70 \href{http://ctan.math.utah.edu/ctan/tex-archive/macros/latex/contrib/biblatex-contrib/biblatex-apa6/biblatex-apa6.pdf}{APA 6th docs}.
71 \href{http://ctan.math.washington.edu/tex-archive/macros/latex/contrib/apa7/apa7.pdf}{APA 7th docs}.
72
73 % For APA 7th TeXLive 2020 use change the figure captions from
74 %
75 % \caption{First sentence. Rest of the caption.}
76 %
77 % to
78 %
79 % \caption{First sentence.} \figurenote{Rest of caption.}

89
90 \section{System setup}
91
92 \subsection{Installing conda environments}
93
94 If you already use conda environments in a recent linux operating
95 system, you can install a minimal conda environment to run the
96 notebooks like so and follow the prompt (or omit -y to the end of the
97 command to install the packages without prompting).
98
99 \begin{minted}{bash}
100 conda create -n apa67_report pandas pyarrow matplotlib jupyter firefox -y
101 $ activate apa67_report
102 $ jupyter notebooks
103 \end{minted}
104
105 If you are not yet set up to use conda environments, you can follow
106 the instructions to download and install a minimal conda installer,

```

```

107 miniconda3
108 (\href{https://docs.conda.io/en/latest/miniconda.html}). This provides
109 just enough infrastructure to create a conda environemnt and install
110 packages as shown in the example above. If you want to create conda
111 environments and install packages faster, then install the `mamba`
112 conda package (\href{https://mamba.readthedocs.io/en/latest/}).
113
114 If you are not yet set up to use conda environments and don't want to
115 be then you are on your own. You can run pipeline\_1.ipynb if you have
116 numpy, pandas, matplotlib and jupyter. You need the spudtr package to
117 run pipeline\_2.ipynb. Older versions are available via pip install,
118 but there is no assurance it is compatible with the versions of
119 packages you already have installed.
120
121 \subsection{Installing \LaTeX}
122
123 \subsubsection{Linux Installation via network}
124
125 You do not need to be root or admin to install TeX Live over the
126 networks and best practices are to install your copy in your
127 directory. That way you control the version and packages you
128 use. First read through the quick installation instructions
129 \href{https://www.tug.org/texlive/quickinstall.html}{here}. Then,
130 (summarizing from
131 \url{https://www.tug.org/texlive/acquire-netinstall.html}):
132
133 \begin{enumerate}
134
135 \item Download \url{install-tl-unx.tar.gz} to some scratch/working
136 directory, unpack the archive, change to the new directory it
137 made, i.e., \mbox{install\textendash tl\textendash YEARMONTHDAY} for
138 whatever version, and run the installer.
139
140 \begin{minted}{bash}
141 $ tar -xf install-tl-unx.tar.gz
142 $ cd install-tl-20200814
143 $ perl install-tl
144 \end{minted}
145
146 Follow the prompts, make sure you are happy with and have write
147 permissions in the default installation directory, and press ``i''
148 to install.
149
150 \item Update your ~/.bashrc file with the path to the new TeX Live
151 installation.
152
153 \begin{minted}{bash}
154 PATH=/home/turbach/texlive/2020/bin/x86_64-linux:$PATH
155 INFOPATH=/home/turbach/2020/texmf-dist/doc/info:$INFOPATH
156 MANPATH=/home/turbach/2020/texmf-dist/doc/man:$MANPATH
157 \end{minted}
158
159 \end{enumerate}
160
161 That's it, you have a complete functioning installation of \LaTeX{}

```

```

162 with the latest packages, TeX Live 2020 as of this writing.
163
164 The installation probably has everything you need including the apa6
165 and apa7 styles used for this report.
166
167 If there is a new package or update you want and you want to manage
168 the TeX packages with the TeX Live GUI you also need to install
169 perl/tk. There is a conda package for this, you can install into any
170 compatible conda env.
171
172 \begin{minted}{bash}
173 $ conda activate some_general_purpose_env
174 $ conda install perl-tk -c BioBuilds -y
175 \end{minted}
176
177
178 \subsubsection{OSX Installation}
179
180 See instructions for MacTeX \href{https://www.tug.org/mactex/}{here}.
181
182 \subsubsection{Windows}
183
184
185 See Quick Install instructions
186 \href{https://www.tug.org/texlive/quickinstall.html}{here}
187
188 and Windows installer instructions
189 \href{https://www.tug.org/texlive/acquire-netinstall.html}{here}.
190
191
